Task 9:

The screenshot shows the Power BI Desktop interface. The main view displays a table with 38 rows and 2 columns. The columns are 'Order ID' and 'Count'. The 'Count' column shows the frequency of each 'Order ID'.

The 'Query Settings' pane on the right shows the query name 'OrderID_Count' and the applied steps: Source, Promoted Headers, Changed Type, Capitalized Each Word, Trimmed Text, Trimmed Text1, Added Custom, Added Conditional Column, Renamed Columns, and Grouped Rows.

The screenshot shows the Power BI Desktop interface. The main view displays a table with 3 rows and 2 columns. The columns are 'Category' and 'Average Profit'. The 'Average Profit' column shows the average profit for each category.

Category	Average Profit
Furniture	9.456790123
Clothing	11.76290832
Electronics	34.07142857

The 'Query Settings' pane on the right shows the query name 'Category_AverageProfit' and the applied steps: Source, Promoted Headers, Changed Type, Capitalized Each Word, Trimmed Text, Trimmed Text1, Added Custom, Added Conditional Column, Renamed Columns, and Grouped Rows.

Task 10:

Brief Summary:

Data Transformation

1. Data Import & Cleansing

- Imported three datasets: List of Orders, Order Details, and Sales Target
- Limited List of Orders to first 500 rows to manage data volume

- Set appropriate data types: Order Date as Date format, Amount and Target as fixed decimal numbers
2. Text Formatting
 - Converted CustomerName column to Proper Case for consistency and standardization across records
 3. Custom Column Creation
 - Location Column: Merged City and State columns in "City, State" format for geographic analysis
 - Profit Margin Column: Calculated as $(\text{Profit} / \text{Amount}) * 100$ to express profitability as a percentage relative to sales
 4. Conditional Column
 - Profit Status Column: Categorized profit/loss scenarios:
 - Profit > 0 → "Profit"
 - Profit = 0 → "Break-Even"
 - Profit < 0 → "Loss"
 5. Data Integration (Merging)
 - Merged List of Orders with Order Details using Order ID as the common key
 - Created consolidated "Orders Data" table combining order-level and product-level information
 6. Aggregation & Grouping
 - Order Count: Counted Order IDs by category
 - Average Profit: Calculated mean profit values by Category
 - Total Amount: Summed sales amounts by Sub-Category
 - Monthly Targets: Aggregated target values by Month of Order Date

Data Modeling

Relationships Established

1. List of Orders ↔ Order Details (via Order ID) - One-to-Many relationship
2. Order Details ↔ Sales Target (via Category) - Many-to-One relationship

These relationships enable:

- Cross-filtering between order and product dimensions
- Correlation of actual sales performance against targets
- *Drill-down analysis from category to sub-category level*

Model Architecture

The star schema design provides:

- Fact tables: Orders Data (transactional details)
- Dimension tables: Sales Target (performance benchmarks)
- Active relationships: Ensure proper data flow for analytics and reporting

This structure supports dynamic analysis, filtering, and visualization while maintaining data integrity.
