Brief Summary:

Data Transformation

1. Data Import & Cleansing

- Imported three datasets: List of Orders, Order Details, and Sales Target
- Limited List of Orders to first 500 rows to manage data volume
- Set appropriate data types: Order Date as Date format, Amount and Target as fixed decimal numbers

2. Text Formatting

- Converted CustomerName column to Proper Case for consistency and standardization across records

3. Custom Column Creation

- Location Column: Merged City and State columns in "City, State" format for geographic analysis
- Profit Margin Column: Calculated as $(\text{Profit} / \text{Amount}) * 100$ to express profitability as a percentage relative to sales

4. Conditional Column

- Profit Status Column: Categorized profit/loss scenarios:
 - Profit > 0 → "Profit"
 - Profit = 0 → "Break-Even"

- Profit < 0 → "Loss"

5. Data Integration (Merging)

- Merged List of Orders with Order Details using Order ID as the common key
- Created consolidated "Orders Data" table combining order-level and product-level information

6. Aggregation & Grouping

- Order Count: Counted Order IDs by category
- Average Profit: Calculated mean profit values by Category
- Total Amount: Summed sales amounts by Sub-Category
- Monthly Targets: Aggregated target values by Month of Order Date

Data Modeling

Relationships Established

1. List of Orders ↔ Order Details (via Order ID) - One-to-Many relationship
2. Order Details ↔ Sales Target (via Category) - Many-to-One relationship

These relationships enable:

- Cross-filtering between order and product dimensions
- Correlation of actual sales performance against targets
- *Drill-down analysis from category to sub-category level*

Model Architecture

The star schema design provides:

- Fact tables: Orders Data (transactional details)
- Dimension tables: Sales Target (performance benchmarks)
- Active relationships: Ensure proper data flow for analytics and reporting

This structure supports dynamic analysis, filtering, and visualization while maintaining data integrity.
